

CuZin™

FREE-FLOWING, NON-SETTLING
COPPER AND ZINC LIQUID FERTILISER

Better soils. Better crops. Better stock.™

Address and prevent copper and zinc deficiencies

CuZin is a liquid fertiliser solution of zinc, copper and sulphur sulphates ideal for use in a range of farming enterprises, especially when addressing and preventing copper and zinc deficiencies is required.

CuZin also provides added benefits from its sulphur content.

Being in a highly available liquid form that is free-flowing and does not settle, uptake to the plant occurs quickly, allowing for the fast correction of deficiencies.

CuZin is suitable for use in grains, horticulture, pastures and vines, and can be applied through foliar application, fertigation, or sprayed directly onto soils.

Direct soil application prior to planting addresses and prevents deficiencies, and ensures emerging plant roots are able to access these nutrients.

BioAg highly recommends applying CuZin before a deficiency occurs, as it is generally easier to prevent deficiencies than to rectify them.

Contains

Zinc as sulphate 110 g/l

Copper as sulphate 40 g/l

Sulphur as sulphate 70 g/l
