

HydraHume

NATURAL SOIL NUTRITION

Better soils. Better crops. Better stock.

Feed the soil

Promote plant growth and root mass

HydraHume provides a single, simple and organic solution for building soil humus and increasing soil fertility.

By directly contributing to humus development, HydraHume increases the soil's water and nutrient holding capacity.

It is an efficient promoter of plant growth and increased root mass, while also improving the effects of fertilisers.

HydraHume rapidly accelerates the microbial activity in soils, developing soil carbon and reducing nutrient lock up.

In HydraHume, BioAg continues to utilise only high-grade raw materials to develop its product range. By choosing leonardite as the principal raw material, we deliver one of the richest sources of humic acid available.

Directions for use

Apply directly to the soil, or by fertigation or pivot.

Direct application 5-20 l/ha.

Fertigation/Pivot 10-20 l/ha.

Preparation: Shake well before use. Jar test for compatibility prior to mixing with other products. Avoid mixing with low pH products. Apply within 12 hours of mixing.

Storage: Store out of direct sunlight.

Do not store mixed product.

- » Build soil humus and carbon
- » Retain nutrients and moisture
- » Promote plant growth and root

Contains

High grade leonardite (North Dakota)
